| ←4 | →3 | ←2 | →8 | <u>→5</u> | →1 | ←7 | ←6 | ←11 | ←10 | ←9 |
| ←4 | →3 | ←2 | →8 | →7 | ←1 | ←5 | ←6 | ←11 | <u>←10</u> | ←9 |
| ←4 | →3 | ←2 | →8 | →7 | ←1 | ←5 | ←6 | ←11 | →10 | <u>←9</u> |
| ←4 | →3 | ←2 | →8 | →7 | ←1 | ←5 | ←6 | ←11 | →10 | →9 |

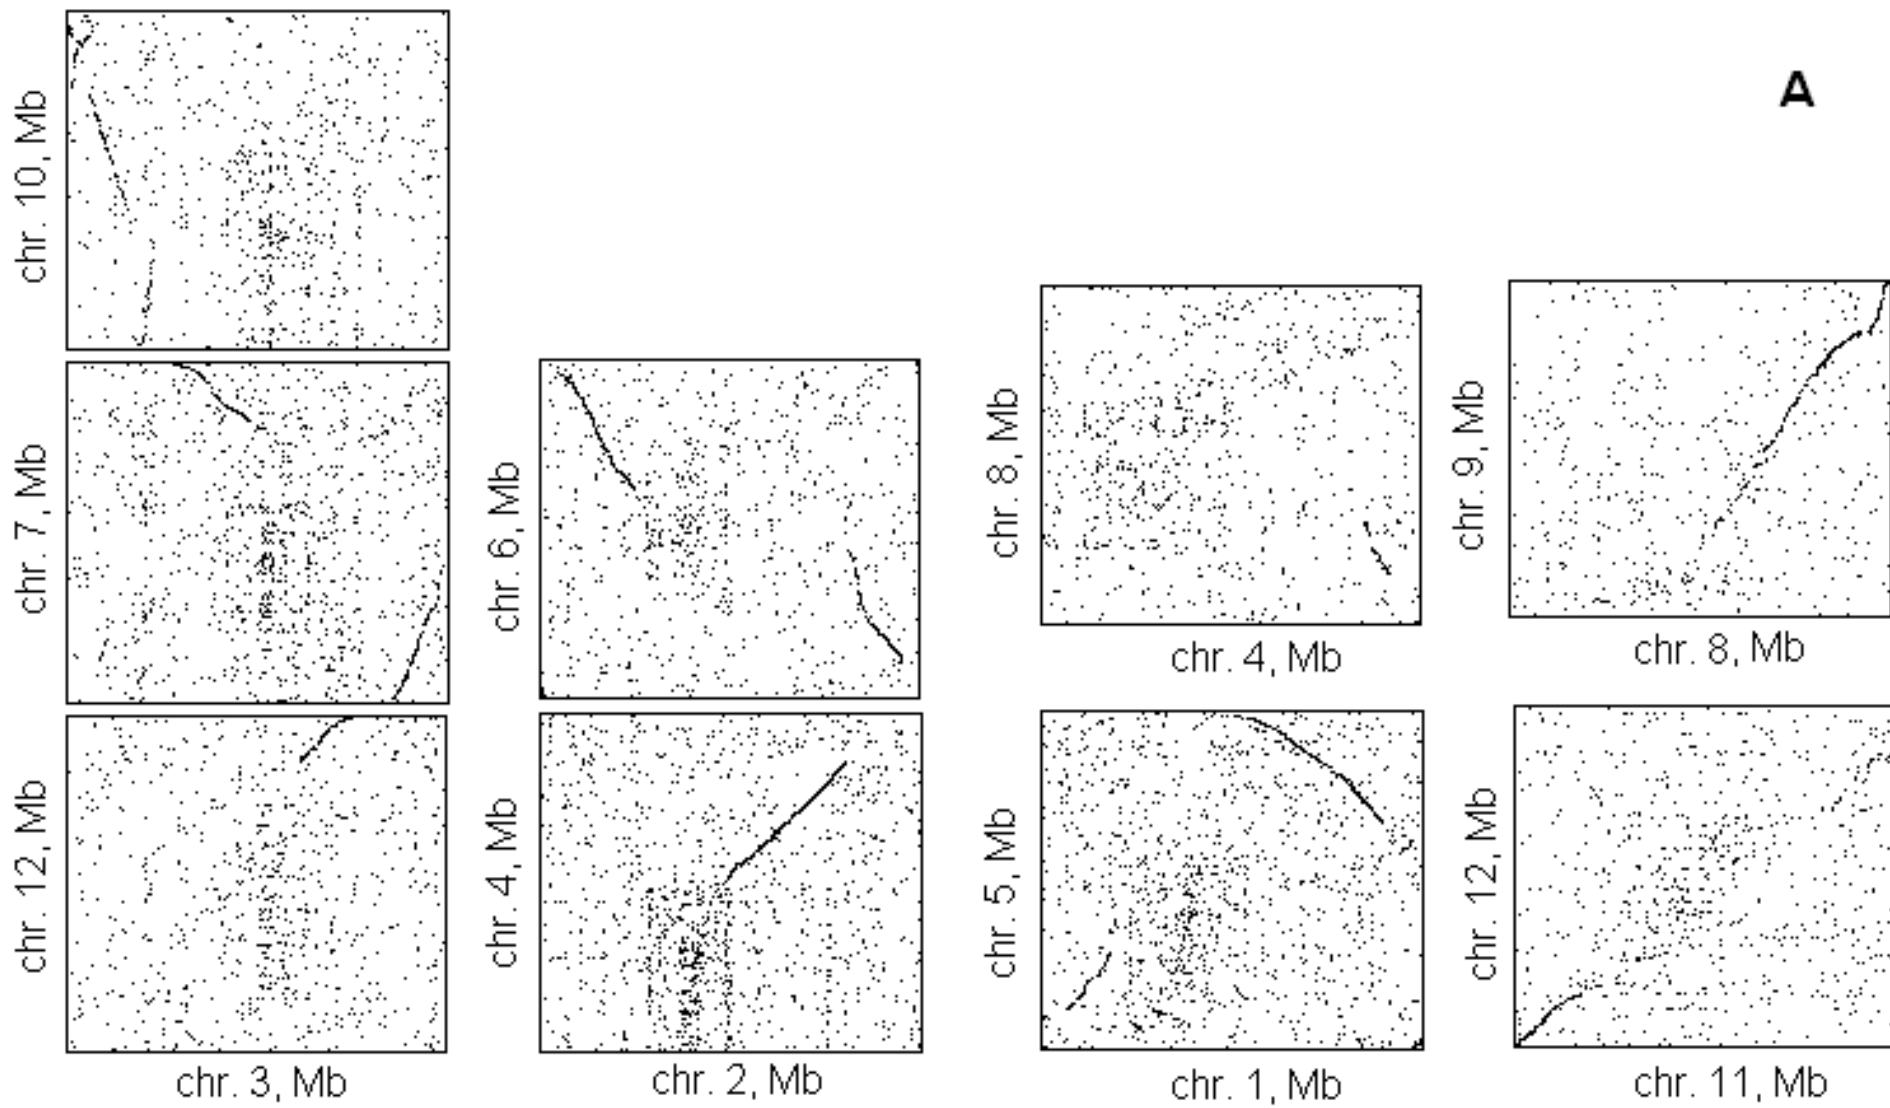

An important conclusion

- ◆ Evolutionary significance of inversions in legume chloroplast DNAs. *Palmer et al, Current Genetics, 1988, 14:65-74*
- ◆ Plant mitochondrial DNA evolves rapidly in structure, but slowly in sequence. *Palmer, J.D. and Herbon, L.A. 1988. J. Mol. Evol. **27**: 87-97.*

Genome rearrangements in mammalian evolution:
 lessons from human and mouse genomes. *Pevzner and Tesler, Genome Research, 2003, 13:37-45*

Rice *(Zhang et al. in press)*

Q: A most parsimonious rearrangement scenario

- ◆ Parsimony assumption: We believe nature can always find the shortest way

2. Operations and distances

- ◆ A brief history: genome rearrangements in molecular evolution (*Dobzhansky and Sturtevant, 1938*); The shortest rearrangement scenario for unichromosomal genome (*Palmer et al, 1988*); Notion of a breakpoint (disruption of gene order) (*Watterson et al, 1982; Nadeau and Taylor, 1984; Sturtevant and Dobzhansky, 1936*); Breakpoint graph (*Bafna and Pevzner, 1993, 1996*); Transforming one genome into another---a polynomial algorithm (*Hannenhalli and Pevzner, 1995*)

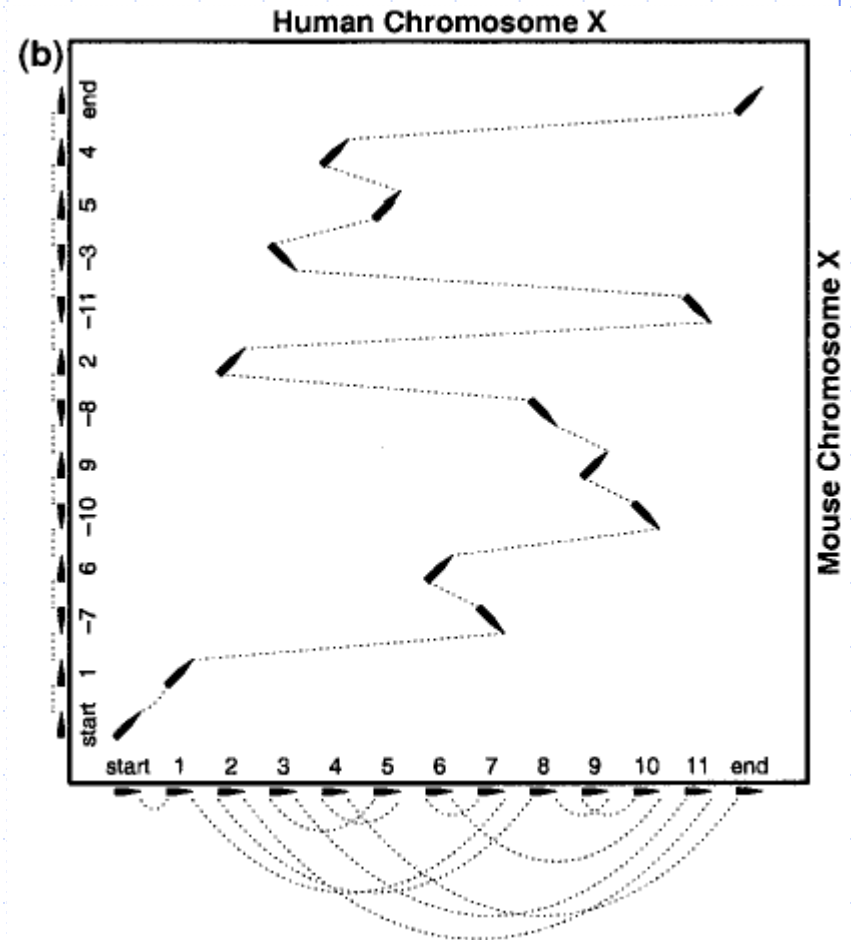

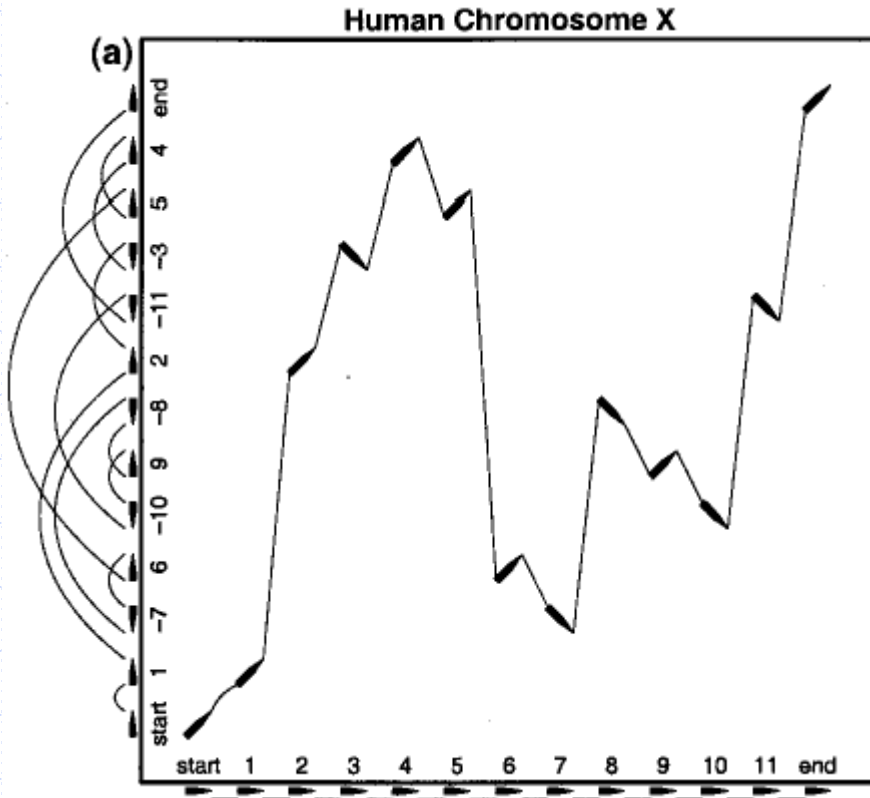

◆ Edit distance

- Reversal distance
- Transposition distance
- Translocation distance
- genomic distance: reversal, translocation, fusion and fission for multichromosomal genomes

◆ Breakpoint

Construction of the breakpoint graph from synteny blocks (Pevzner and Tesler, 2003)

Human Chromosome X

Human Chromosome X

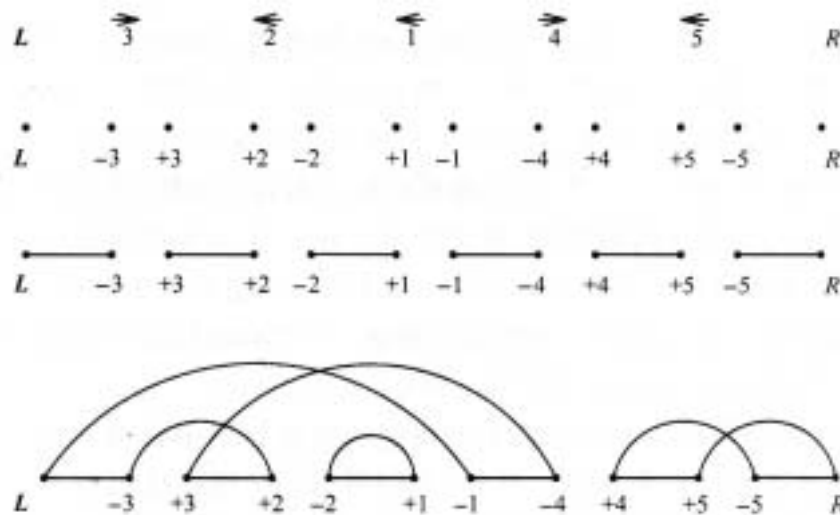

Mouse Chromosome X

Reality-desire diagram

◆ (Setubal and Meidanis, 1997)

◆ (Sankoff and El-Mabrouk, 2002)

An alternative description for the parsimony question

- ◆ Number of cycles (c) is maximized when $H1=H2$, in which case each cycle has one black edge and one gray edge
- ◆ How to maximize a RD diagram using the least operations?

3. The Hannenhalli-Pevzner Theory

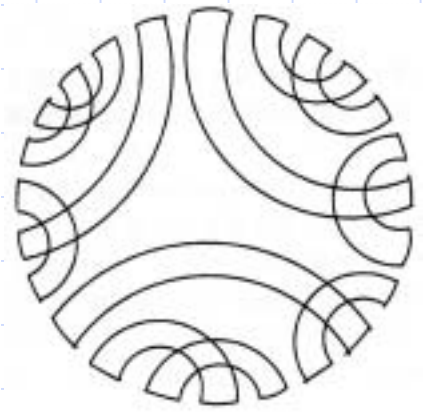

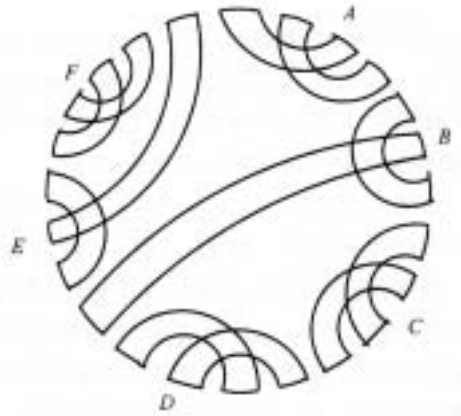

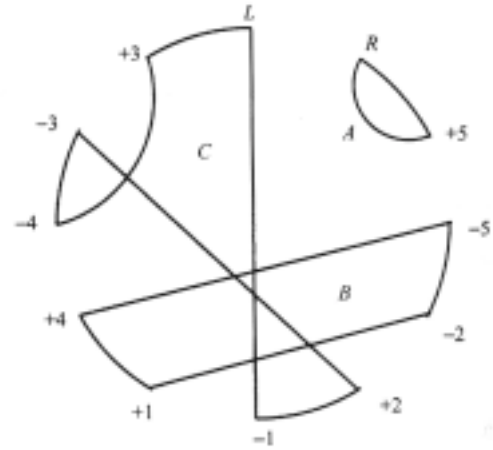

- ◆ Polynomial-time algorithms for calculating the edit distance between two genomes
- ◆ The Hannenhalli-Pevzner formula:

$$d(H_1, H_2) = n(g) - c(g) + m(g) + f(g)$$

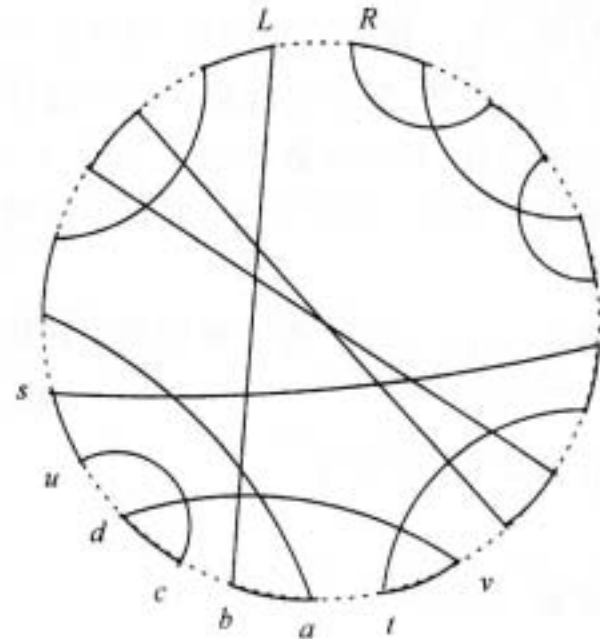

where $d(H_1, H_2)$ is the minimum number of rearrangement operations (reversals and/or translocations), $n(g)$ is the number of black edges of g , $c(g)$ is the number of cycles, $m(g)$ is the number of bad components, and $f(g)$ is a correction of size 0, 1, or 2 depending on the set of bad components.

- ◆ Size of a cycle: the number of black edges it contains, for example, size 1.
- ◆ A rearrangement operation: proper, improper or bad. Difference between the number of cycles before and after applying the operation: 1, 0, -1
- ◆ A component: good or bad. A component is termed good if can be transformed to a set of cycles of size 1 by a series of proper operations, and bad otherwise.

Example

How many steps do they have to go?

26 genes Reversal Distance: 10

One optimal reversal scenario

| Step | Description | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 |
